Ausplow products are created for just one purpose:
To increase your crop yields. Year after year. And better
yields come from better soil.

Breaking New Ground for Farmers.

Ausplow wants to make a profit. Sure. Just like you. But money is not our primary goal. Rural people with a lot of agricultural experience run this company, not shareholders. We're inventors with a lifelong love of the land. And a curiosity about it. We're obsessed with finding better ways to increase plant nutrition and crop yields.

This obsession is driven by the belief that there's no point saving the planet if it sends you broke. Likewise, what's the

sense of making good money now if you're slowly killing the pastures of tomorrow?

We believe the key to achieving the sweet spot that every farmer is chasing – environmental sustainability and business success – is the soil.

Products That Back The Promise.

Agricultural food production the world over is exploding with new technology. But you can have the best of everything and still not achieve the profits you need if you haven't got the right soil environment. Our products have become some of the most adopted seeding systems in the history of Australian agriculture. They improve the soil's water-holding capacity, reduce water erosion, increase the levels of organic carbon and in some areas, even promote the return of earthworms. Our Deep Blade System builds a healthier long-term soil environment by creating better pathways for moisture, air and root penetration; all critical factors for healthy plant growth.

Our Product Range

DBS Tine

The DBS modules are designed for separate seed and fertiliser delivery.
